

# Chart Integration

Chart recorders provide records of flow conditions, and must be “integrated” in order to accurately account for the gas volume represented on the chart. Chart integration involves retracing flow (differential pressure), static pressure, and

temperature recordings, then applying these results to the individual station parameters in order to determine gas volume.

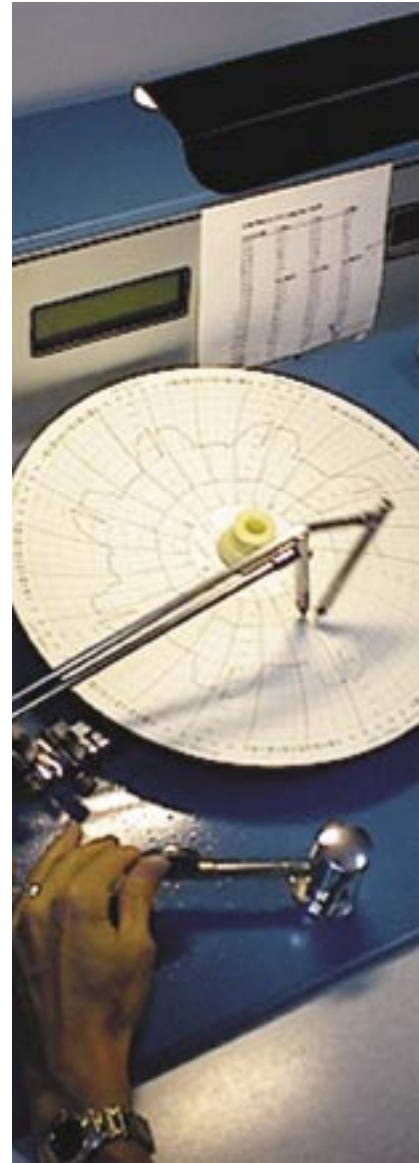

EMS Pipeline Services provides the highest quality chart integration and auditing services by combining well-trained personnel and the best equipment available. We employ experienced operators who utilize modern integration equipment to produce accurate results. Reliable chart integration requires integration experience and dedication to accuracy.

## Chart Integration includes:

- Qualified personnel – EMS Pipeline Services has chart integration services with more than 24 years of experience in the industry.
- Detailed quality assurance and quality control procedures
- Thousands of charts processed per month

## EMS Pipeline Services representatives are specialists in Intermediate Flow Patterns, 2 Speed Integration, 1st Purchaser Volume Calculation and Gas Purchaser Audit reporting and the following processing services.

- Flow Charts
- Temperature Charts
- Chart Auditing
- Database Interface
- Daily Breakouts
- Censoring and Validation
- Experienced Operators
